The Myth of Multitasking While Driving

According to a new study eating while driving is more dangerous than using a cell phone or being above the legal alcohol limit. In fact, the reaction time of drivers who eat a snack while driving is 44 percent slower than normal and when sipping a drink responses were 22 percent slower and drivers were 18 percent more likely to experience poor lane control.

To ensure the safety of those in your vehicle and other drivers on the road, avoid the following:

- Using your cell phone
- Drinking a beverage
- Eating a snack
- Unnecessary passenger conversation
- Changing the destination/route header signs
- Operating MDT unit or any fare box operations

MULTITASKING AND DRIVING DON'T MIX!
